

python.analysis.typeCheckingMode is a setting for the Pylance extension in Visual Studio Code that determines the level of static type analysis performed on your Python code.

Available Modes

- **Off (Default):** Disables broad type checking. It still reports critical issues like unresolved imports and undefined variables but keeps noise to a minimum for loosely typed projects.
- **Basic:** Activates a fundamental set of type-checking rules designed to catch common errors without being overly restrictive.
- **Standard:** Builds on basic by adding rules for return types, argument types, and assignment types.
- **Strict:** Enables the highest level of analysis. This mode requires comprehensive type annotations and will flag "Unknown" types that cannot be inferred. Visual Studio Marketplace

You can change this setting through the VS Code UI or directly in your configuration files:

- Open Settings (Ctrl+,)
- Search for `python.analysis.typeCheckingMode`
- Select your preferred level from the dropdown

Configuring through settings.json:

- Add the following line to your workspace or user settings: json
`"python.analysis.typeCheckingMode": "basic"`
- **Project Files:** This setting can be overridden by a `pyrightconfig.json` or a `pyproject.toml` file in your project root.

If a specific mode is too strict or too loose, you can use `python.analysis.diagnosticSeverityOverrides` to adjust individual rules (like `reportMissingTypeStubs`) while keeping the overall mode intact.
